

DK1 for 3D design

Are you tired of working with 2D interfaces? 9D interaction is the bridge between your software tools and Mixed Reality platforms!

3D computing platforms (Virtual and Augmented Reality) are becoming core components of digital transformation (DX). Current 3D platforms rely on point and click style motion controls which are bottleneck for the complex interactions required in 3D design applications.

Our 9D stylus combines the best of all worlds – the familiar control set of a mouse with 6D position tracking and 3D force feedback. We offer the user a unique physical presence within the design tool. By supporting 9D interaction technology, software vendors can fully realise VR and AR platforms in their workflow.

- Engineering design and part assembly,
- Architecture,
- Virtual testing,
- Character / asset design,
- Rigging & animation
- Rendering & texturing

And many more...

Please get in touch with us to discuss your application or arrange a demonstration!
